

Claude responded: ---

Position 2 — Standard (Cha Ghor type)

The operator: 5–10 table place. 3–4 waiters. The manager is often the owner himself — possibly running the floor *and* checking his phone between tables. Checks this once at end of lunch, once at end of night. Primary question: **"Aaj kemon gelo?"**

Cash is dominant. Online orders may not even exist. Card is rare. Staff scoreboard is irrelevant — he knows his 3 waiters personally.

HERO ZONE

- ₳14,820 in displayHero. Full width. Delta chip vs yesterday — that's the only comparison that means anything to him. He doesn't think in 7-day averages.
- One-line insight below in bodyMedium muted: *"Lunch e strong chilo — kal er cheye ₳1,090 beshi"*. Keep it conversational, keep it Bangla-first.
- Three stat pills only: **Orders · Covers · Peak Hour**. Drop Avg Ticket at this position — a 5-table owner doesn't manage by ticket size, he manages by footfall.

SECTION 1 — Revenue by hour

- Bar chart. Today only — no ghost average, no toggle. He has no mental model for 7-day averages yet.
- Peak bar annotated directly on the chart. No floating text line below it.
- This is the only chart on this screen. One chart maximum at P2.

SECTION 2 — Top items

- Ranked list, top 5. Item name · order count chip · revenue. That's it.
- No margin data. He doesn't track food cost yet.
- No "See all." Menu tab handles that.

That's the whole screen. No source breakdown. No staff section. No quadrant matrix. If cash/card/online split is needed, it lives inside a collapsible row at the very bottom — *"By source"* — defaulting closed. Most P2 operators will never open it.

Position 3 — Advanced (Spice Garden type)

The operator: 15–40 tables. 8 staff. There's separation now — owner is not always on the floor. A manager handles shifts. The owner checks this morning-after or late night. Primary questions: **"Revenue kemon chilo, cost thik ache, staff e kono problem chilo?"**

FC% is now a real concern. Staff performance starts to matter because he can't personally watch everyone. But he's still a Bangladeshi restaurant operator — not a hospitality consultant. Jargon needs to be plain.

HERO ZONE

- **৳42,380** in displayHero. Delta vs 7-day average now — he has enough history for this to mean something.
- One-line insight: keep the dinner peak / capacity style callout.
- Five stat pills: **Orders · Covers · Avg Ticket · Turns/Table · Food Cost %**. FC% earns its place here at the top — this operator checks it daily.

SECTION 1 — Revenue by hour

- Bar chart with 7-day ghost average line in **lineStrong**. Today vs average toggle makes sense here.
- Peak annotation on the bar directly.

SECTION 2 — Staff today *(moved up from bottom)*

- This is end-of-service. He wants to know if anyone underperformed *before* he locks up, not as an afterthought below three other sections.
- Compact row per waiter: Name · Covers · Avg Ticket · Comps. **TOP** badge on best performer.
- No full scoreboard here — that lives in the Staff tab. This is a pulse, not a report.

SECTION 3 — Ki beshi bikri holo / What sold

- Top sellers with revenue + margin %. Margin % earns its place at P3.
- **warningSoft** chip on any item with margin below a threshold — e.g. a high-volume item eating into profit. No quadrant matrix. The matrix concept was right but the execution was wrong for this audience. Replace it with a single callout row if something needs attention: *"Lamb Karahi — beshi bikri kintu margin kom. Check korben."* Plain language. One line. Actionable.

SECTION 4 — Where it came from

- Cash · Card · Online — visible by default at P3 because online orders are now plausible and card use is growing. Three value chips in a row, no chart needed.

SECTION 5 — Revenue by source trend *(collapsed by default)*

- If he wants to see whether online is growing week over week, it's here. Collapsed. Most won't open it daily.

Position 4 — Enterprise (Pirates Group)

The operator: Multi-outlet owner. Checks this morning or end of day. Primary questions are: total fleet health, which outlet is the problem, and what operational issue needs attention today.

Current problem: The "Operational health" section (late %, waste %, variance) is the most urgent content on this screen and it's at the bottom. The outlet list and the operational alerts need to swap priority. Also **BATCH** and **STEADY** tags have no legend.

HERO ZONE *(always visible)*

- Fleet revenue today **₹1,84,200** in displayHero, vs 7-day average delta
- One-line insight: "4 of 5 outlets above target — Dhanmondi leading by ₹5,860" — keep this
- Four stat pills: Covers · Avg Ticket · Fleet FC% · On Goal (X/5) — "On Goal" replaces the current "Fleet YC" label which is ambiguous

SECTION 1 — Operational health *(move this to FIRST scroll stop)*

- This is the section the owner is most anxious about. A 14% late rate or ₹620 stock variance is a problem that needs a call *today*.
- Keep the three alert rows: Highest late % / Highest waste % / Stock variance — but give each a functional color treatment. Late = **urgentSoft**. Waste = **warningSoft**. Variance negative = **dangerSoft**. Currently they all render in neutral chips.
- Add "Capacity right now" here too — 92% FULL / 78% BUSY / 68% STEADY — but define the labels. A single **labelEyebrow** key: "FULL >85% · BUSY 60–85% · STEADY <60%" as a muted footnote under the section header. One line. Fixes the ambiguity.

SECTION 2 — Outlets today *(second scroll stop)*

- Ranked outlet list stays. Revenue + FC% + delta chip per outlet.
- **TOP** and **BATCH** tags need a legend — but don't add a floating key. Instead, make the tags themselves tappable: tap **BATCH** opens a bottom sheet with one sentence: "Revenue batch processed — reconciliation pending." Tap **TOP** shows "Highest revenue outlet today." Zero extra screen real estate used.
- "See compare" CTA stays — good placement.

SECTION 3 — Fleet top movers *(third scroll stop)*

- Aggregate top items across outlets. Currently missing from the design — it exists in the product spec for Enterprise but wasn't visible in the recording. Add it: top 5 items fleet-wide with outlet count (e.g. "Beef Tehari — ₹1,84,000 across 4 outlets").

SECTION 4 — Where it came from *(last, collapsed)*

- Same collapse logic. Fleet-level Cash/Card/Online. Useful for accountants, not for the owner's daily scan.

Cross-cutting fixes that apply to all three

Tab label clarity: The **Manage** / **Review** tab split is correct, but "Review" is a weak label for what it actually does. Consider **Insights** or **Today** — something that signals *this answers questions* rather than *this stores data*.

Scroll anchoring: On all three, the section eyebrow labels (**Revenue by hour** চার্টটি দেখুন, **By source** উৎস) are currently the only scroll landmarks. Add a sticky section counter or a subtle progress indicator at the right edge so the operator knows how much screen is left — reduces the "is there more?" anxiety on a long scroll.

Delta chips: Positive deltas are currently **success** green, negative are **danger** red — correct per design rules. But the *size* of the delta matters. A -2% FC% is fine; a -14% outlet revenue is a crisis. Consider a **dangerSoft** background on the chip only when the magnitude crosses a threshold (e.g. >10% negative), keeping small negatives as plain **danger** text on neutral background. Avoids alarm fatigue.
